For Domestic Catgirl Corp

Catgirl Tracker Forever

A guide for owners and kittens

This guide is for the owners and the kittens of Domestic Catgirl Corp. It is for roleplay. It is about Catgirl Tracker Forever the way you live with it: what she feels, what you click, and what the guild hears.

Both of you run the addon. She is a kitten when her guild note names an owner. You are that owner when the note names you. The guild master is a third person, named by hand, who keeps the week. The master is a different role from her owner, unless the same person is written in both places.

If her officer note has any writing, that is the note the addon reads. If the officer note is empty, it reads the public note. Write `owner=` and then her owner's name. `First Last` and `First-Last` are the same person. A comma ends the name. A first name on its own is someone else. A kitten who cannot see officer notes will not see an owner written only there, so put it where she can read it if her client hides officer notes.

The owner window follows one kitten, the first whose note names you. She has to be in the world for an order to take hold. If she is away, it waits until she is back. The button is what dresses her. The whisper that follows is the scene. Typing those words by hand leaves her as she was.

A small **cgcc** button sits near the top of your screen. You can drag it. It comes back when you log in. Click it, or type `/cgcc`, to open Catgirl Control.

What she sees

Her heat bar and her submissiveness bar appear once she has an owner. Under the submissiveness bar she can read today's orgasms, today's denials, and when that day resets. While she is in heels, two more bars sit with them: how fast she is walking, and how far this pair has trained her.

Her heat, her submissiveness, and the two heel bars while she is learning to walk

When you put something on her, a picture of it appears in front of her for a moment. What she is wearing stays as a row of small pictures at the top of her screen. She can drag that row. A piece on a timer shows the time left under its picture. A strike from your hands shows a smaller picture. Taking something off leaves the row, and the big picture stays away.

Other things live on her screen when they are needed. A dim veil when she is leashed. A dark or a mask when she is blindfolded. A paw at her cursor when her mittens are on. A reminder when a bell is on her. A small window for her cat. A small window for her maid work. A warning across the screen when it is time to nap.

Guild lines about a headpet, a nap, slacking, a heel fall, or her cat stay in her own words. A gag does not rewrite them.

The owner window

The window is Catgirl Control. It has five tabs: Stats, Control, Toys, Discipline, and Settings. Control, Toys, and Discipline keep each group closed until you open it. Hover a name and a larger picture of that piece appears. A small icon sits beside the row.

With no kitten assigned, the kitten buttons stay quiet. Stats says that most functions are not available. Advertise, Nya, debug, and the module switches stay yours, because they belong to this character.

Once she is yours, the top of the window names her. If it has not heard from her yet, it says there is no snapshot. Refresh asks again. The page fills in as she reports, and it keeps painting while the window is open.

The picture below is the older window. It is here as a picture of the idea. Forever uses the same tabs and the same closed groups. Open one and the pieces inside are split into Apply and Remove. Each timed removal has its own little box for the time, beside that removal, under Remove.

The older control tab, closed groups for leash, gags, blindfolds, ears, bells, mittens, chastity, heels, and tracking

The older window with a group open, and a large picture when the name is hovered

What the stats page shows

Stats is the first tab. Refresh is at the top.

The picture is the older stats page, as a picture of the idea. Forever's page is the same kind of look at her. It shows her three heel skills, her heat, how many times she has come, the last time, today, this week, how many times she has been denied in all, how many denials today, and when today resets. The two bars sit under that. Pictures of what she is wearing come next. Then the time left on anything locked to a clock. Then a plain list of what is on her: gag, blindfold, ears, mittens, heels, bells, jewel, belt, bra, and leash. Toys that are in her are listed with them, including when one is humming or filled. If the tracking jewel is on and you are on the same map, the page also says how far she is. Otherwise that distance stays unknown.

The older stats page: skills, heat, orgasms, the two bars, and the gear she is wearing

Heat, submissiveness, orgasms, and spanks

Heat and submissiveness are two different feelings, and they tug on each other.

Heat is how worked up she is. It rises while she is dressed, while a worn toy is left in her, while she is on her leash, and while her owner handles her. Left alone, it fades, even if she logs out. When the bar fills, she is right on the edge. If her chastity belt is set to allow, she comes, and the heat empties. If the belt is set to deny, the orgasm is refused. Heat falls back from the top, and that denial stays with her for the rest of the day.

Submissiveness is how deeply she is in it right now. It comes from her heel training, from how much she is wearing, and from how the day has gone between denials and orgasms. A high bar does not add heat by itself, but it changes how she responds to being toyed with.

Raising submissiveness

Keep her dressed. Gear, worn toys, and the leash all lift the bar. The more she is in, the higher it sits. Take something off and that part falls at once.

Let her practice her heels. All three styles count, even the ones she is not wearing. That skill stays with her. An orgasm does not take it away, and midnight does not take it away.

Deny her when heat fills. Each denial today makes her more sensitive for the rest of that day. She feels the next toy more deeply.

Lowering submissiveness

Allow the orgasm. An orgasm today offsets the denials from today.

Wait for midnight for the kitten's orgasms and denials to clear.

Take gear off. That eases her at once. She does not have to wait for midnight.

Her owner's hands, and a toy

Her owner's hands add heat. A spank does. The rest of that discipline does too. It never cools her, and it does not change her submissiveness on its own. This is how you walk her up to the top of the heat bar, where she will either come for you or be denied.

A kitten being punished by a toy, and not by the hand of her loving owner, can be a rather negative experience for a kitten. If your kitten's submissiveness is low and you punish her with an automated toy, it will decrease her heat, as the pain or panic overwhelms her. Though if she is submissive enough, those automated toys can add a lot to your kitten's heat bar all on their own, and for hours on end. Also keep in mind the intensity matters. She might have enough submissiveness to get turned on by a mild shock, but getting a big zap might make her more scared than turned on, depending on how submissive she feels.

How an owner uses this

If you want her soft and deep in it, leave her dressed, let her keep practicing her heels, and deny her when heat fills. A denial makes the next automated toy more likely to arouse her instead of scare her. The heat climbs again. Deny her again, and the day stacks on itself.

If you want her to come down, allow the orgasm, take the gear off, and wait for midnight. Her owner's hands will still warm her. They are not a way to lower the bar.

She can see today's orgasms, today's denials, and when those counts reset, under her submissiveness bar. You can see the same day on the stats tab.

Names used above

Name	What she feels	Which things
Her owner's hands	Discipline from you. It always warms her.	Spank Hand, Pinch, Crop, Paddle, Heart Crop, Whip, Vibrating Wand, Shock Wand
Worn toys	Left in or on her. They warm her for as long as they stay.	Small Butplug, Large Butplug, Taill Butplug, Inflatable Butplug, Inflatable Dildo, Vibes Pussy, Vibes Nipples
Automated toys	They can zap her without your hand. A mild zap and a big zap are not the same, and her submissiveness right now decides which way it goes. Left in, they also warm her on their own.	Dildo, Vibes Ears, Nipple Piercings, Ear Piercings, Pussy Lipps Piercings

When she is allowed to come, the moment flashes over her and the heat empties. When the belt refuses her, it shocks her, the heat falls back from the top, and the denial is kept. That lifetime of denials stays on the stats page. The day underneath her bar is only today.

Dressing her

Everything you put on her is on the Control tab, in a group you open. Apply is how it goes on. Remove is how it comes off, including a removal you set for later.

Gags

A gag changes the speech everyone hears: say, yell, party, raid, guild, officer, and the instance. A whisper and an emote stay in her own words.

The cute kitten mask leaves the words and pushes nya, and little faces, into every sentence. She will feel the urge.

A small gag softens her letters and leaves a nya on the end. She can still be understood, if you listen.

A heavy gag takes the words away. What comes out is only a muffled sound, the same sound a few times.

The kitty mask with a gag stops her completely. She is told that nothing can escape, and the line she tried to say never goes out.

An inflatable gag starts soft. Inflate and Deflate are their own buttons, the same idea as the toy picture further down. A little air and she still talks, with a muffled edge. More air and the words break up. All the way up and she can only moan. As it gets fuller she starts to drool on her own.

Ungag gives her voice back.

Blindfolds

A light blindfold dims the world. She can still click.

A cute kitty blindfold plays a mask closing over her screen. Taking it off plays the mask opening again.

A full blindfold goes black, and she cannot click through it. She is told when she can see again.

Mittens

Lockable paw mittens spoil her paws. A paw follows her cursor. A spell on her bar is covered, and it creaks when she tries to cast. The spell is put back, and then the paw takes it again.

Squeaking paw mittens are lighter. They squeak when she casts, and they only meddle with a spell for a short turn, now and then.

While she is on the leash, that meddling waits. She can follow. When the leash comes off, the paws start again if the mittens are still on.

Removing the mittens gives her paws and claws back, and the covered spell is restored.

Heels

Three pairs live in this group: maid heels, high heels, and ballet boots. The button names them. The higher the heel, the harder it is to walk, and an untrained kitten in the ballet boots will hurt sooner.

While they are on, she watches the balance bar. Walk slowly. If she runs, the bar flares, she falls, a picture of the heels covers her for a moment, and the guild can hear that she fell. She is warned to take it slow.

The level bar fills as she practices the pair she is wearing. All three skills stay with her after the heels come off. You can see each level on Stats. A fall does not wipe the skill. Midnight does not wipe it either. Her steps click

while she walks.

Ears

Earmuffs change what she hears, once she has an owner. Say, yell, party, raid, and guild come through the muffs. Her own typing still follows the gag, if she is wearing one.

Kitten earmuffs sprinkle nya through other people's sentences. She can follow them, with a lot of nya in the way.

Heavy earmuffs turn what she reads into a mush of stars and tildes. The meaning is gone until you take them off.

Bells

A collar bell rings at odd moments while she is moving. The screen reminds her that it might ring at the wrong time.

A tail bell rings with her steps, and the screen says so. If she stands still, the jingling stops. If you are close enough to be with her, you can hear the bell too.

Each bell comes off on its own button.

The leash

Leash clips her to you. Her screen dims and tells her to press 1 to follow. Once she is following, it tells her to click to stop. The spells that were sitting on her bar are put back when you unleash her. The person who leashed her is the one who can take it off.

The leash warms her for as long as it is on. It also lifts her submissiveness while it is clipped. There is no timer on the leash. You take it off yourself.

Chastity

The belt seals her pleasure. The bra seals her chest. Each has its own lock and its own removal.

On the belt, Deny Orgasm and Allow Orgasm are the choice from the heat section. Deny keeps her on the edge when the bar fills. Allow lets her come. Taking the belt off lets her feel again, and the belt returns to allow.

While the belt is locked, a toy or a strike that belongs under it will not go on and will not land. The bra does the same for her chest. You will be told when something is refused. Ears, and anything that is not under the belt or the bra, can still be reached.

Timed locks

Every piece above, except the leash, can be set to come off later. The jewel and the toys are the other exceptions: they wait for you.

Open the group, look under Remove, and find the line that says the piece comes off in so many hours. A small box sits beside that line. It starts with a suggestion. Type how long you want, then click the line. That box belongs to that piece. Each timed removal has its own.

The time keeps going if she logs out. If it runs out while she is away, the piece is already off when she returns, and she is told then. On her screen the time sits under the picture. On your stats page it is listed with the other timed removals.

If you take the piece off yourself, the timer is simply gone. She does not get the "time ran out" speech. Changing to another style of the same piece keeps the time you already set. A heavy gag in place of a small one is still that gag's clock.

Toys

Toys are the second tab. The picture is the older window, as the idea of the list. Forever keeps the same toys, each in a group you open. Inside, you put it in, take it out, and use whatever that toy can do.

The older toys tab, one closed group for each toy

The three names in the heat section are the whole toy box. Worn toys warm her for as long as they stay. Automated toys can zap her, and her submissiveness right now decides whether that zap warms her or scares her. Left in, those warm her too.

You do not need a different ritual for each one. Open it. Apply puts it in her. Remove takes it out. If it hums, a vibe control turns that hum up. If it shocks, the shock control is the zap, and a mild one and a hard one are not the same feeling. If it inflates, Inflate and Deflate are separate. The picture below is the older window of that idea. Forever does the same: the fill and the release are their own buttons, and the inflatable gag on the Control tab works the same way.

The older toy group, with Inflate and Deflate as their own buttons

She wears one buttplug at a time. Putting another in takes the first one out. A toy that belongs under the belt or the bra is refused while that lock is on. Stats lists what is in her, and whether it is humming or filled.

Her owner's hands

Discipline is the third tab. These are her owner's hands from the heat section. They always warm her. They do not move her submissiveness on their own. The picture is the older window, the list of tools kept closed until you open one.

The older discipline tab: the tools, closed until you open one

Open a tool, choose where it lands, and choose how hard. A harder stroke is a stronger warmth. You have to be close to her, and the tracking jewel has to be on, or the strike does not land. Step in, and make sure the jewel is clipped to her collar, if the click stays quiet.

A place the belt or the bra is sealing will refuse the stroke. You are told. Pick somewhere the lock is not covering, or take the lock off first.

An emote spank, and an emote pinch of her ear, are a different gesture. Those are covered with headpets, kisses, and hugs. The buttons on this tab are your hands on the heat bar.

Naps

After she has been online for a good while, a warning crosses her screen. It tells her that good kittens nap, to find an inn, and how long a proper nap is.

She uses the sleep emote while she is resting, inside that window. Stay down for the length the warning asked. Getting up too soon makes her a cranky kitten who woke early. Sleeping on past it makes her a kitten who slept all day. Ignoring the warning means she did not listen, and her owner should punish her. A nap kept properly asks the guild to give her headpets and praise.

Moving, or leaving the rest of the inn, ends the nap. The guild hears which kind it was. Then the wait begins again, and the next warning comes when she has been online long enough once more.

Slacking at the inn

Resting at an inn out in the world, without having just gone to sleep, is slacking. After she has lingered, the guild hears that she was caught slacking off in the inn again. The time she stays after that is remembered when she finally leaves.

A real nap is quiet on this count. If she has just gone to sleep, that rest is her nap, and the slack call stays away.

A capital is home, and it is not slacking. Orgrimmar, Stormwind, Ironforge, Darnassus, Undercity, Thunder Bluff, Shattrath, Silvermoon, and the Exodar do not count. She has to be resting somewhere else.

This can be turned off with the other modules. It starts on.

Her cat

A small window asks her to summon her cat. The button reads "Summon your cat Nya !" She needs one of the carrier cats in her collection: a Bombay, a Cornish Rex, a black tabby, an orange tabby, a Siamese, a silver tabby, or a white kitten. A renamed cat of those kinds still counts. A hunter pet does not.

She clicks the button and the cat comes out. Another click puts the cat away. She cannot do it in combat, or while she is dead. While she is dead the button asks her to summon again. When she is alive and the cat is out, the button praises her and the line underneath says the cat is summoned.

The line also shows how long until the addon looks again. The first time it looks and the cat is missing, she gets a private warning to summon Nya. If the cat is still missing the next time, the guild hears that she forgot. Summoning the cat clears that warning.

The cat window can be turned off with the other modules. It starts on. The guild line about forgetting is a scolding. It is separate from the weekly scorecard.

Headpets, kisses, and hugs

This listens to emotes aimed at her.

Someone who pets her, hugs her, or blows her a kiss is counted. The guild can hear that she was good and what she received, and from whom. A spank emote and an ear-pinch emote are counted too, as her being a bad kitten, and the guild can hear who did it. Those emotes are this tracker. They are separate from the Discipline tab.

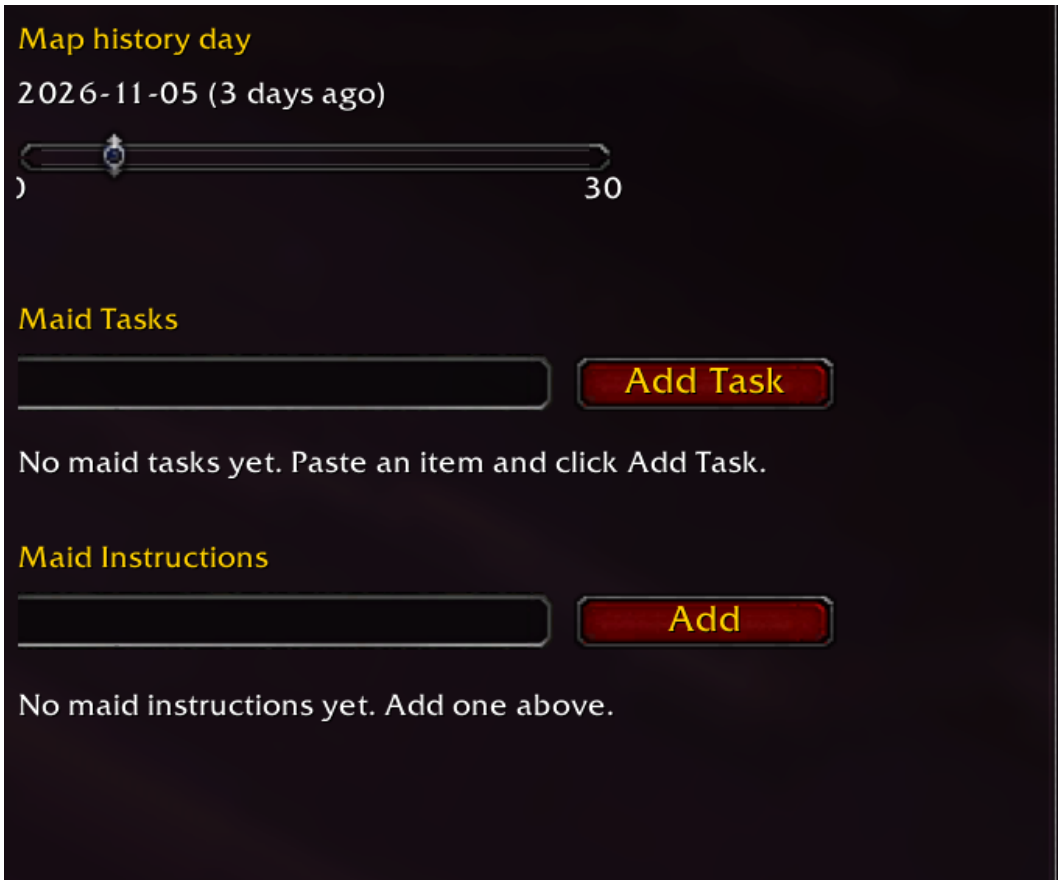

A burst of the same gesture from the same person counts once, until a little time has passed. The week remembers the gestures, and it remembers who gave them.

This starts on. You can turn HeadPetTracker off if the guild should stay quiet and the week should stop counting them.

Maid tasks

On Settings, Maid Tasks is where you paste an item and click Add Task. Maid Instructions is where you write what she should do and click Add. Each list can be trimmed with Remove on that line. The same item twice, or the same instruction twice, is left as the one line. If a list is too long to send, it does not go through, and it does not count.

The picture is the older settings page, as the idea of those two editors and of the map day above them. Forever keeps both editors on Settings. An empty list says so, and tells you to paste an item or add an instruction.

The older settings page: the map day, maid tasks, and maid instructions

On her screen, a window she can drag shows the instructions as a numbered list, and it shows those items as your inventory, with how many you are carrying. When both lists are empty, her window hides.

Sending the same list again is quiet. Changing it is a task for the week, counted once when the new list arrives. MaidTasks starts on. If you turn it off, she will not take the list.

Nya

NyaChat is on Settings, under the maid editors. It rewrites chat this character types: say, yell, party, raid, guild, officer, whisper, emote, and channel. It stays off until you enable it. A gag still happens first, so a heavy gag or a full mask still takes the words. The addon's own lines, including maid notes and the cat, stay as they are.

Enable Nya, then choose the habits. Append nya. Tildes. Little ascii faces. Nya sprinkled through the sentence. UwU. Kitty words, so a yes becomes something softer. A stutter. Sparkle on the punctuation. A small action, a purr or a flick of the tail. Lowercase. A face trailing at the end.

Chance is how often a habit takes. A preview under the switches shows a sample of the voice, so you can hear it before she speaks. The choices belong to this character. You can sweeten your own chat, or hers, each on their own settings.

The map

The tracking jewel is on the Control tab, in Tracking. Clip it to her collar and her walks can be remembered. Take it off and the new walks stop. She does not see her own trail.

KittenMapShow starts off. Turn it on from Settings, or with `/cctmodule KittenMapShow`. Then open your world map to the zone she is in. Her walks that day are dots on the map. Hover a dot for the time. Standing in one place for a while is one dot, with the span of that stay. Today also shows where she is right now.

The slider on Settings, above the maid editors, picks the day. Today is one end. About a month back is the other. A day she did not walk with the jewel on stays empty. The picture of that slider is the older window, in the settings picture above. Forever uses that same day choice.

The dots are for you. The guild master does not receive the trail.

Force Kitty Group sits in that same Tracking group. She invites you into a party. If she is already in a group, she leaves it and then invites you. This is how you pull her to you. It is the group button on her Control tab.

Her owner's hands need this jewel, and they need you close. The stats page can tell you the distance while the jewel is on and you share a map.

The weekly scorecard

The week is kept for the guild master. You do not open a window to read it in the game. There is no copy to click.

Name the master with `/cctmaster` and their name, `First Last` or `First-Last`. Until that name is set, the week is not sent. While the master is online, her week is delivered to them.

For her, the week remembers time in heels, time gagged, maid lists that actually changed, the highest her heat climbed, orgasms, denials, how long she was online, and how submissive she was when the record was sent. It remembers headpets, hugs, kisses, emote spanks, and ear pinches, and who gave them. It remembers how many times she was caught slacking, and how long she lingered. It remembers her naps: kept, cut short, slept through, or ignored. It remembers the places she spent her time.

For you, the week remembers what you put on her and what you took off, the strikes from your hands, and the maid tasks you sent.

When the week turns, that slate starts fresh. Her lifetime of orgasms, and her lifetime of denials, stay on the stats page. Those are hers. They are a different memory from the week. The addon keeps no transcript of guild chat. The scorecard is the memory.

The small switches

Settings also has debug, the five modules, and Advertise. These stay clickable with no kitten assigned.

Debug, and `/cctdebug`, make the addon talk when you are trying to see why something stayed quiet. Leave it off for roleplay.

`/cctmodule` with nothing after it lists the five modules. `/cctmodule` and a name turns that one on or off. The same switches are checkboxes on Settings.

HeadPetTracker, InnSlackerTracker, PetTracker, and MaidTasks start on. KittenMapShow starts off. What each one does is in the sections above.

Advertise, on Settings, opens a small window of five lines. `/cgcc advertise` opens the same window. You can open it before a kitten is assigned. The lines are kept for a shout, and a gag leaves them in the words you wrote. Shouting from that window stays off.

`/cctmaster` with no name tells you who the guild master is, or that the name is still empty.
